Summary

Comparative between Mapbox and Google Maps features, customizability and price for “Social.” React Native application.

Mapbox excels in visual design, heatmaps, and performance; Google Maps excels in accuracy, POI data, and navigation.

Overview

1. Customization & Design

Mapbox offers full styling control (layers, colors, icons, fonts) and native heatmap layers, while Google Maps provides heatmap and limited styling (colors and labels only). Mapbox uses vector tiles (lightweight and fast), supports offline maps, and allows branded UI themes. Google Maps is raster-based and more restrictive for styling and offline use.

2. POIs (Places of Interest)

Google Maps maintains its own global POI (Point of Interest) database with near real-time updates from businesses and users, ensuring very high accuracy. Mapbox relies on aggregated sources (OpenStreetMap, Foursquare, etc.), updated periodically. For commercial or frequently changing POIs, Google Maps is significantly more reliable.

3. Technical Integration in React Native

Mapbox (“@rnmapbox/maps”) supports full vector styling, heatmaps, and offline rendering. Google Maps (“react-native-maps” with provider=Google) is easier to integrate but offers limited customization. Both can use external APIs (e.g., Google Places or Mapbox Geocoding) for POI detection.

4. Pricing & Scalability

Mapbox pricing is MAU-based (50,000 monthly active users free), predictable and cheaper at scale. Google Maps charges per request, offering $200 in free credits monthly (~28k map loads). Heavy usage becomes significantly more expensive on Google Maps.

5. Licensing & Data Ownership

Mapbox allows caching, offline use, and custom data layers. Google Maps prohibits storing or mixing its data with other sources. Mapbox is generally more flexible for apps that need to blend or visualize proprietary data.
